	(2) Unlisted Funding Project Types
	Co34 funding project types are not listed. Co 34 activity is included in calculation of Co1
	funding project type allocation rates and are applied to identical Co34 funding project types.
	Co35 funding project types are not listed. Co 35 activity is included in calculation of Co2
	funding project type allocation rates and are applied to identical Co35 funding project types.
	Due to the unique nature of individual projects assigned to the following funding project
	types, plant account allocations are forecasted for each project:
	Co1 ED Specific Svcs FP

	(3) Plant accounts with less than the amount of activity needed to round to 1% of allocated
	activity are generally excluded from allocations
	(4) Palo Verde Nuclear Generating Station allocation rates are calculated using a 6 year
	average to assure complete 18 month outage cycles are used for all three units

	(5) Electric plant account allocations are adjusted for the following by Funding Project Type:
	• Co1 ED Bldg/ Structs/ Imprvmnts FP - a correction for misclassification of Structures and
	Improvements between FERCs 361 and 390 was made in 2024 for 2023. That correction
	was removed to calculate an accurate 2 year annual average for 2024-2025. The correction
	affected the following projects: 10031922 Gen Svcs Bldg Maint Blanket-Distr, 15130521
	Alamogordo Fleet Facility, 15230521 Ruidoso Metal Building, 15530621 Silver City Metal Building.
	• Co1 ED Intangible FP - All Grid Modernization projects associated with G/L Location 105
	are excluded.
	• Co1 ED Othr General Plant FP - All Grid Modernization projects associated with G/L Location 105
	are excluded.
	• Co1 ED Transport Equip FP - Non-recurring activity for the following project was the only
	activity in 2025. Non-recurring activity for that project for FERCs 363.1, 363.2, 390 and 392.1
	are excluded in 2024. The project is: 60030322 EV Charging Infrastructure. The 2 year
	annual average was determined using 2023-2024 after the noted exclusion.
	• Co2 ET Bldg Imprv FP - There is no activity in 2025 for this Funding Project Type.
	Non-recurring activity for the following project was excluded for 2023-2024: 65030821
	Power Ops Backup Ctr at Aztec-WFF. The 2 year annual average was determined using 2023-2024
	after the noted exclusion.
	• Co2 ET PNM Participant FP - Due to unusual net credit activity for 2023-2025, the
	2 year annual average was determined using 2021-2022.
	• Co2 ET Spec Minor Const FP - Activity for the following project which should have been
	classified as a Co2 ET Spec Major Const FP Funding Project Type is excluded: 65009318
	BB2-Diamond Tail to Clines Corners.
	• Co7 Building, Struc, Improve FP - Non-recurring activity for the following project is
	excluded: 97230523 Masthead Building Purchase.

EDAM Cost Benefit Analysis

Note 1: Due to the complexity of Computer Software depreciation, expenses are manually input into the Plant workpaper based upon calculations performed in PowerPlan. Depreciation on Software accounts are not isolated by project in the Plant workpaper. Therefore, depreciation was manually calculated based on a 5 year life, and an in service date of November 2027.

Note 2: EDAM plant consists of only software assets, which do not incur property tax

Note 3: Income taxes are calculated by multiplying Rate Base by the WACC Grossed up for taxes, less the Return on Rate Base

Overview Market Participation Study

OVERVIEW OF MARKET BENEFIT STUDIES

Scope of Studies

Scope: to simulate the specific EDAM/M+ designs for realistic market footprints, not a simplified representation of a wholesale market across the entire WECC

- **Calculate multiple benefit metrics:** (1) Adjusted Production Cost (APC), (2) impact on short-term wheeling revenue, (3) loss of bilateral trading profits, and (4) EDAM/M+ congestion and transfer revenues
- **Model the EDAM and/or M+ GHG structure:** as specified in the design or contemplated design
  - EDAM: simulated the "GHG Reference Pass" to set limits on transfers into the GHG region (CA and WA).
  - M+: simulated "Resource Owner, Merit Order w/ Enhanced Floating Surplus" approach to setting transfer limits into GHG regions
  - Modeled resource-type-specific GHG costs
- **Simulate existing & prospective real-time markets:** WEIM in parallel with the EDAM, formation of a day-ahead and real-time market with M+, nodal representation of entire WECC
  - Estimated the impact on existing WEIM and new EDAM or Markets+ trades and congestion revenues
- **Capture value of coupled day-ahead and real-time markets to manage unexpected imbalance:** modeled renewable and load forecast uncertainty between DA and RT
- **Realistically represent bilateral markets:** captured existing contract-path transmission rights, major trading hubs, block trading, CAISO intertie trades, hourly BA-to-BA trades, and wheeling charges where applicable

Privileged and confidential.

OVERVIEW OF MARKET BENEFIT STUDIES

Key Model Features

- Model developed in PSO/Enelytix, which contains state-of-the-art features
  - Simultaneously optimizes contract path and physical constraints
  - Models bilateral, day-ahead, and real-time markets sequentially through multiple solution cycles
  - Co-optimizes storage resources with other resources in unit-commitment and dispatch
  - Detailed ancillary service and operating reserve modeling and co-optimization of ancillary services with energy
- **The study year is 2032**, which aims to reflect the first decade of markets operations, representing an intermediate year that captures known changes in resource mix and transmission infrastructure
- **Model includes two extreme weather events** based on a historic cold snap and a historic heat wave
  - These events are modeled as single weeks in which we increase modeled loads (peak and energy) and gas prices beyond the typical weather-normalized values to reflect the increased strain on the system and the ramifications of markets for addressing such strain.
  - Capturing non-weather-normal impacts is becoming increasingly important due to the increasing frequency of severe weather events
- **Modeled hydro represents average hydro year in the WECC,** using data from 2009 for hydro generation
- **Study base cases include footprints for EDAM and Markets+, in addition to existing WEIM and WEIS markets**, meaning all noted cost and benefit metrics include the impact of changes in real-time market participation, but exclude the impacts on entity WEIM and WEIS market benefits of the *formation* of the EDAM and Markets+ markets and the separation of WEIM.

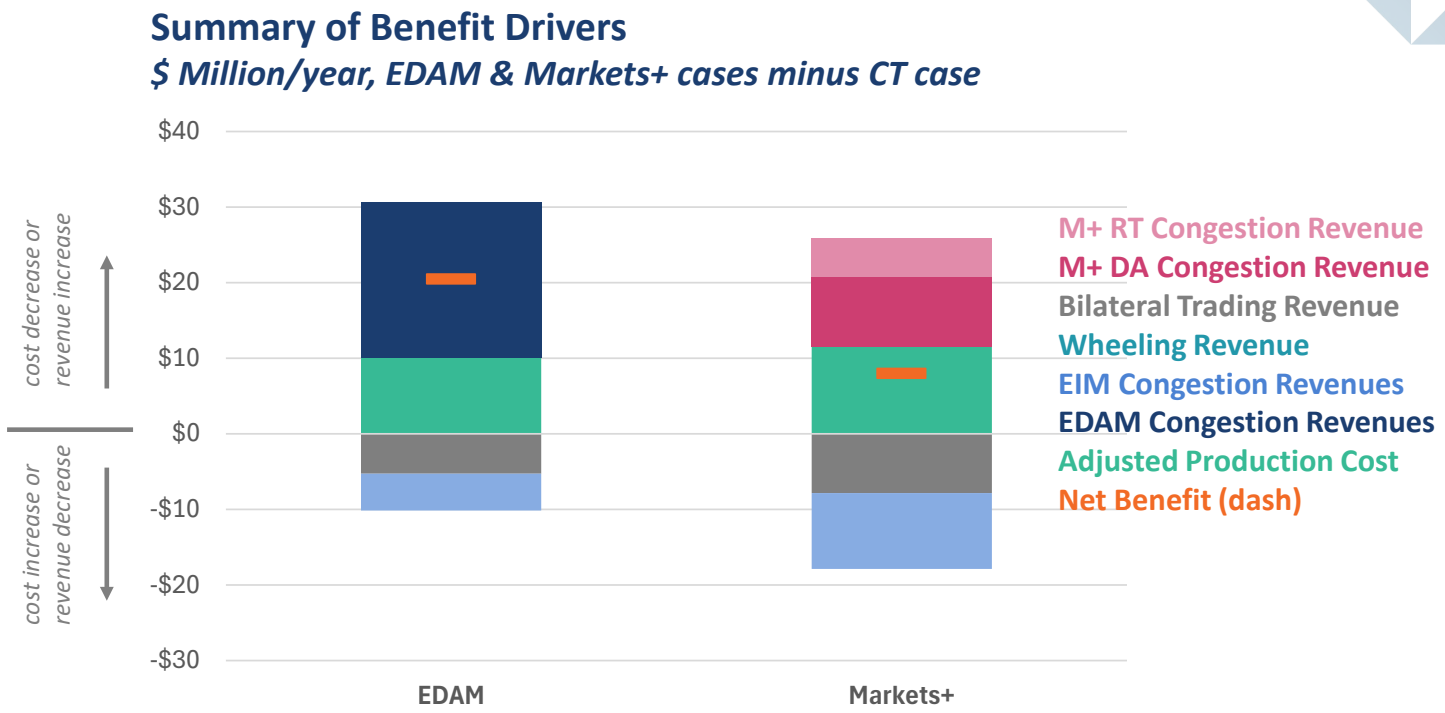
EDAM and Markets+ Benefits Driver Summary

- EDAM benefits driven by EDAM trading revenues and APC savings
- Markets+ benefits driven by APC savings and M+ trading revenues, though with a big offset from lost EIM trading revenue



Adjusted Production Cost Benefit in EDAM

_____ decreases by $10 million in the EDAM case:

1. The generation and production cost remain almost unchanged
2. Increased sales volume and sales price in the day-ahead reduces the APC by $14 million

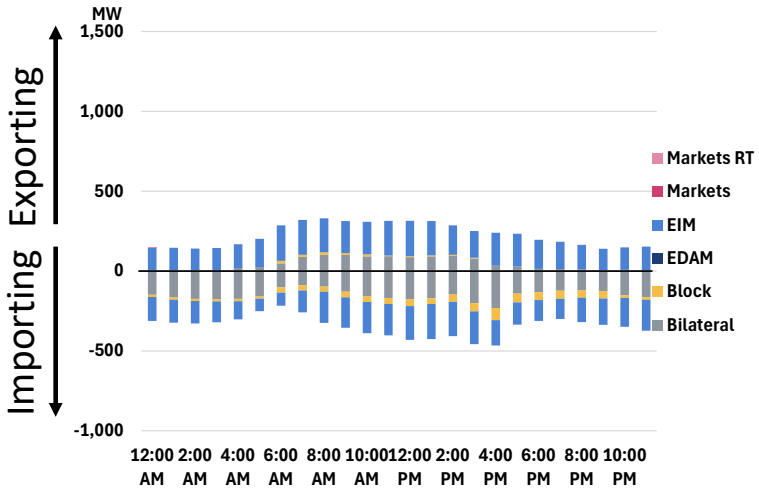
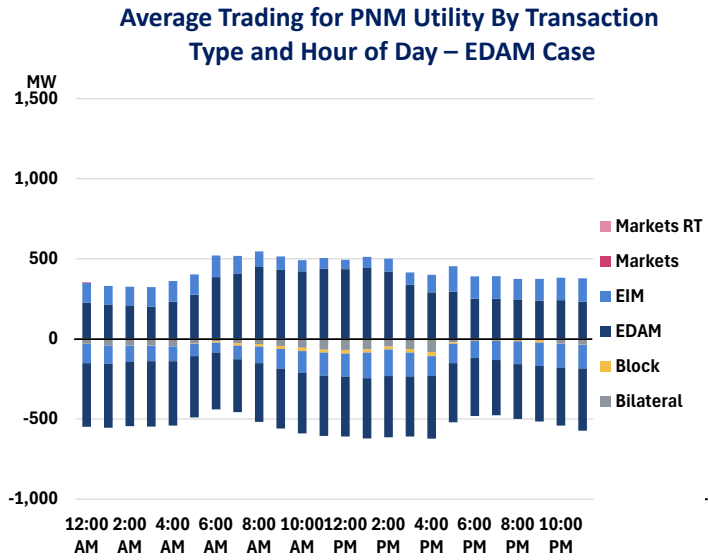
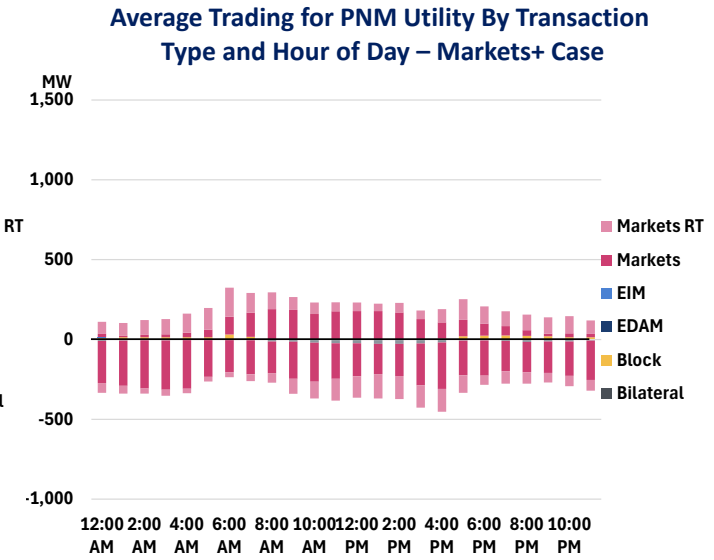
EDAM produces modestly higher volumes for PNM Utility as well

- Average EDAM + EIM hourly volume is about 900 MW of transfers, while average Markets+ hourly volume is around 500 MW of transfers
- Block and bilateral trading dries up in the Markets+ case, as most entities around PNM & EPE are in Markets+ also
  - Remaining block and bilateral trades are mostly with PACE and IPCO at Four Corners







MARKET PARTICIPATION BENEFITS: PNM UTILITY

Participation in EDAM and Markets+ primarily increases utilization of batteries, but also modestly increases solar and wind generation, and increases gas generation in Markets+.

Appendix:
Modeling Assumptions

BENEFITS METRICS

Benefit Metric: Adjusted Production Cost

Adjusted Production Cost (APC) is a standard metric used to capture the direct variable energy-related costs from a customer impact perspective

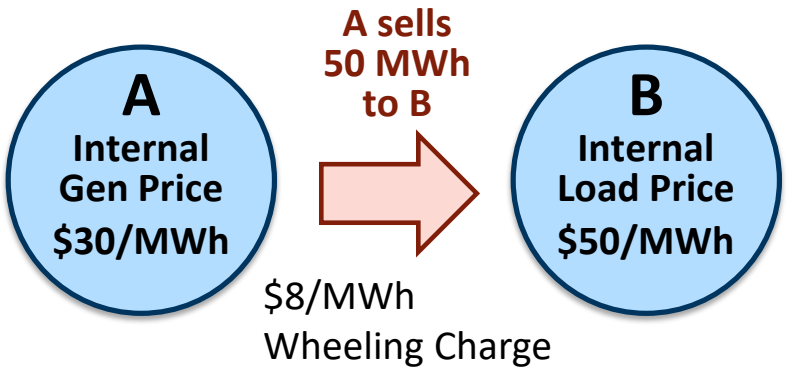
The APC is calculated for the BAU Case and the RTO case to determine the RTO-related reduction in APC

- By using the generation price of the exporter and load price of the importer for sales revenues and purchase costs, the APC metric does not capture wheeling revenues and the remaining portion of the value of the trade to the counterparties (see next slide)

BENEFITS METRICS

Benefit Metrics: Wheeling Revenues, Trading Gains

- **Wheeling Revenues:** collected by the exporting BAAs based on OATT rates
- **Trading Gains:** buyer and seller split 50/50 the trading margin (and congestion revenues in EIM/EDAM)



The APC metric only uses area-internal prices for purchase cost and sales revenues, which does not capture part of the value:

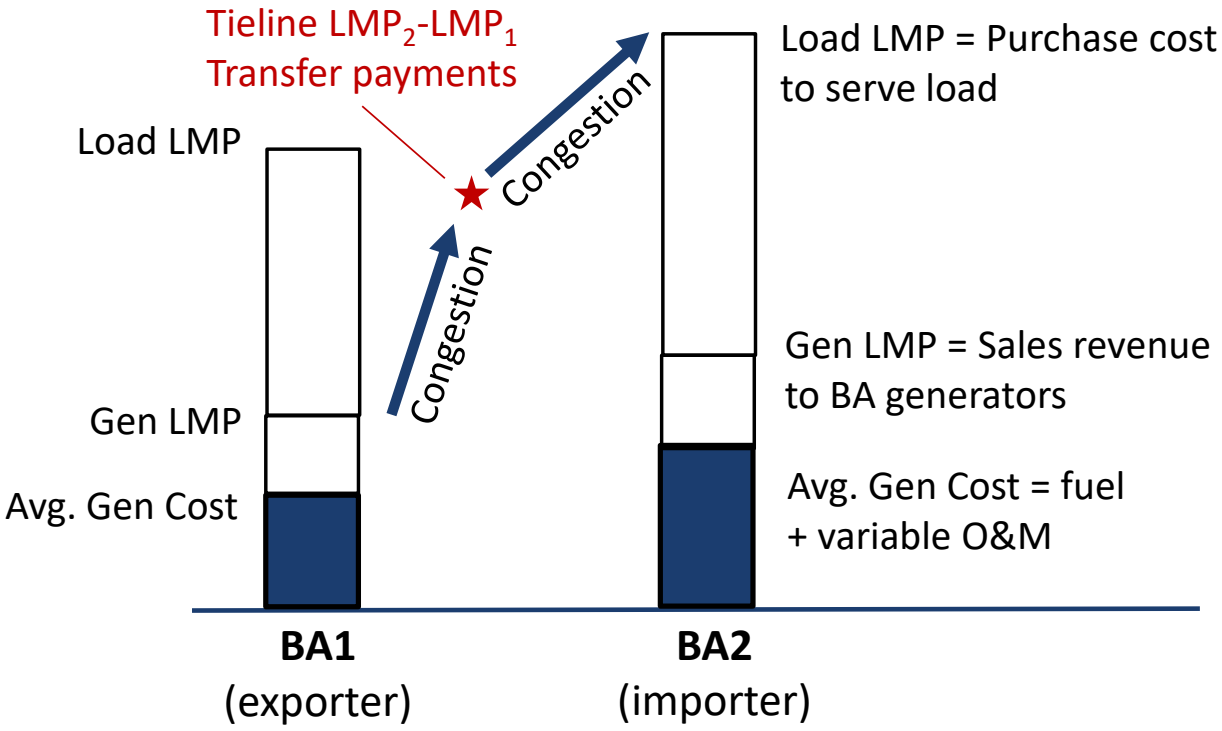
- A receives $30×50MWh=$1,500 in APC sales revenues
- B pays $50×50MWh=$2,500 in APC purchase costs

➔ $1,000 of trading value not captured in APC metric

Trading value = $20/MWh Δprice x 50 MWh = $1000

- Exporter A receives wheeling revenues: $8/MWh x 50MWh = $400
- Remaining $600 trading gain split 50/50: both A and B receive $300

BENEFITS METRICS

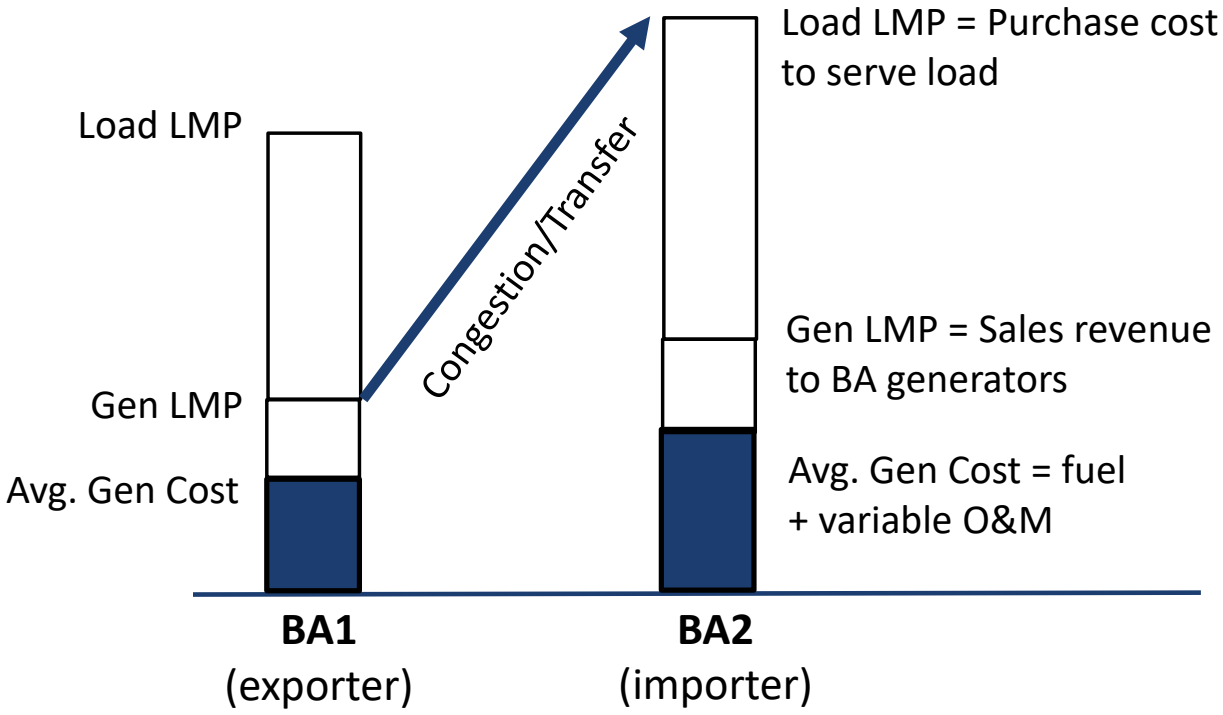


EDAM congestion and transfer revenues estimated based on individual tieline LMPs:

- **Congestion Payment (to exporter) = MW x (Tie LMP_1 – Gen LMP_1)**
- **Congestion Payment (to importer) = MW x (Load LMP_2 – Tie LMP_2)**
- **Transfer Payment (split 50/50) = MW x (Tie LMP_2 – Tie LMP_1)**

BENEFITS METRICS

Illustration of M+ Congestion/Transfer Revenues



M+ congestion/transfer revenues rolled together and estimated based on BA load and gen LMPs:

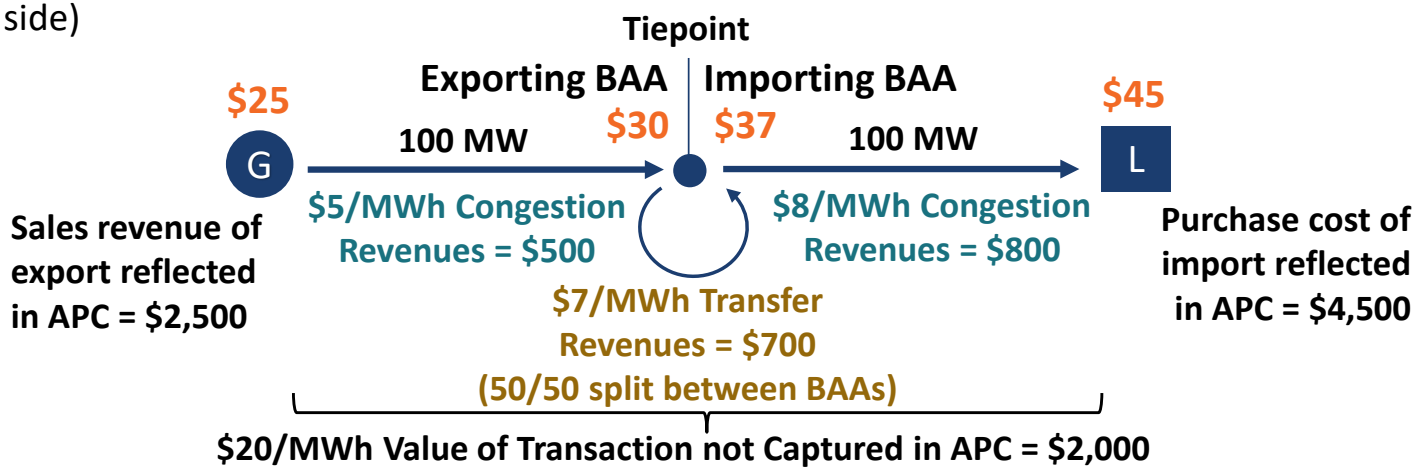
- **Congestion/Transfer Revenue Payment (split 50/50) = MW x (Load LMP_2 – Gen LMP_1)**

BENEFITS METRICS

Illustration of Congestion/Transfer Revenues vs. APC

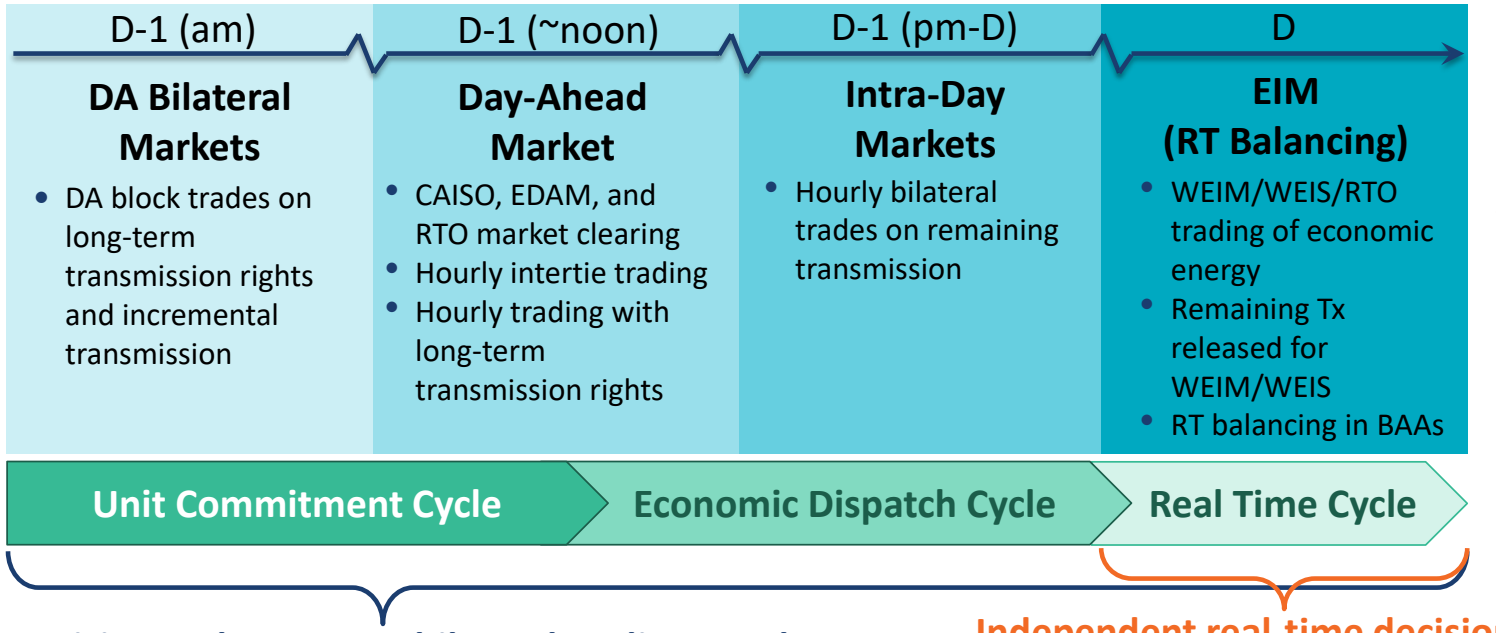
Generators and loads get paid/pay the prices within their BAAs

- Therefore, congestion on internal transfers (between a member's own gen and load) is captured in the APC metric.
- However, congestion/transfer revenue on external transactions (to neighboring members) is not captured in APC.
- In the example below, for an external market transaction, the selling BAA has a price of $25 and the purchasing BAA has a price of $45.
  - The $20 difference between the seller and buyer is the congestion and transfer revenue.
  - **$5/MWh of congestion revenue** is allocated to the seller ($30 on their side of the intertie less $25 internal gen price)
  - **$8/MWh of congestion revenue** is allocated to the buyer ($45 internal load price less $37 on their side of the intertie)
  - **$7/MWh of transfer revenue** is split 50/50 between the buyer and seller ($37 on the buyer side of the intertie less $30 on the seller side)



STUDY ASSUMPTIONS

Independent Simulation of Multiple Time Horizons



Independent real-time decision cycle used to simulation EIM functions

Decision cycles capture bilateral trading, market clearing, BAA functions in DA and RT, and market cycles (EDAM "GHG reference" pass, EDAM market, and EIM)

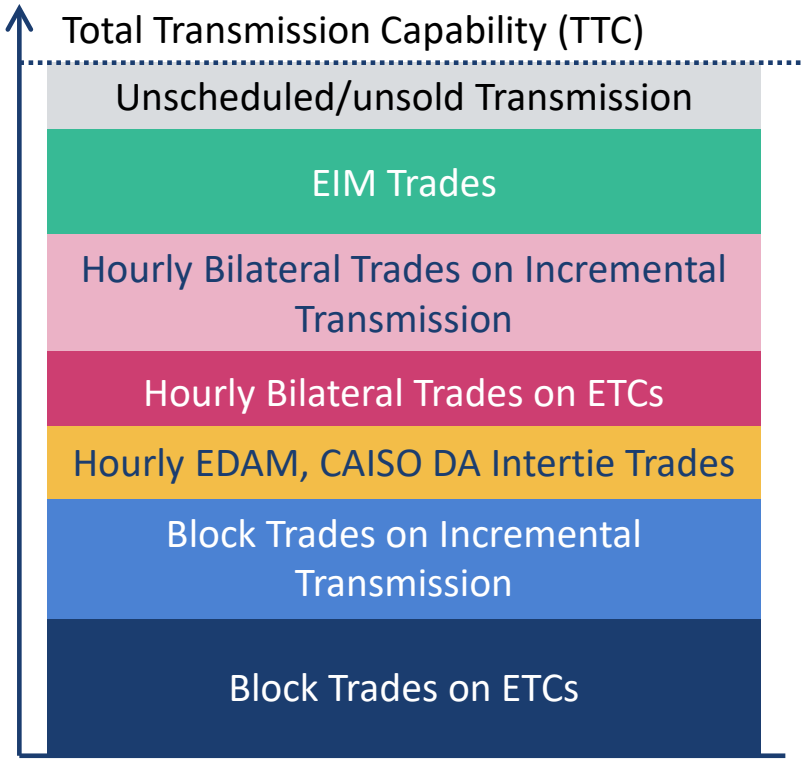
Independent real-time decision cycle used to simulate DA vs. RT, including forecast errors for wind and solar

STUDY ASSUMPTIONS

Types of Trades and Transmission Reservations Modelled

The model simulates the use of different types of contract-path transmission reservations for bilateral trading in DA and RT

- Existing long-term transmission contracts (ETCs) and incrementally purchased transmission
- Total reservations on each contract path is limited by the total transfer capability (TTC)
- Trades are structured as blocks or hourly
- Bilateral trades between BAAs, at major hubs, or across CAISO interties
- Account for renewable diversity and day-ahead forecast uncertainty vs. real-time operations
- Unscheduled transfer capability released for EIM trades in real-time

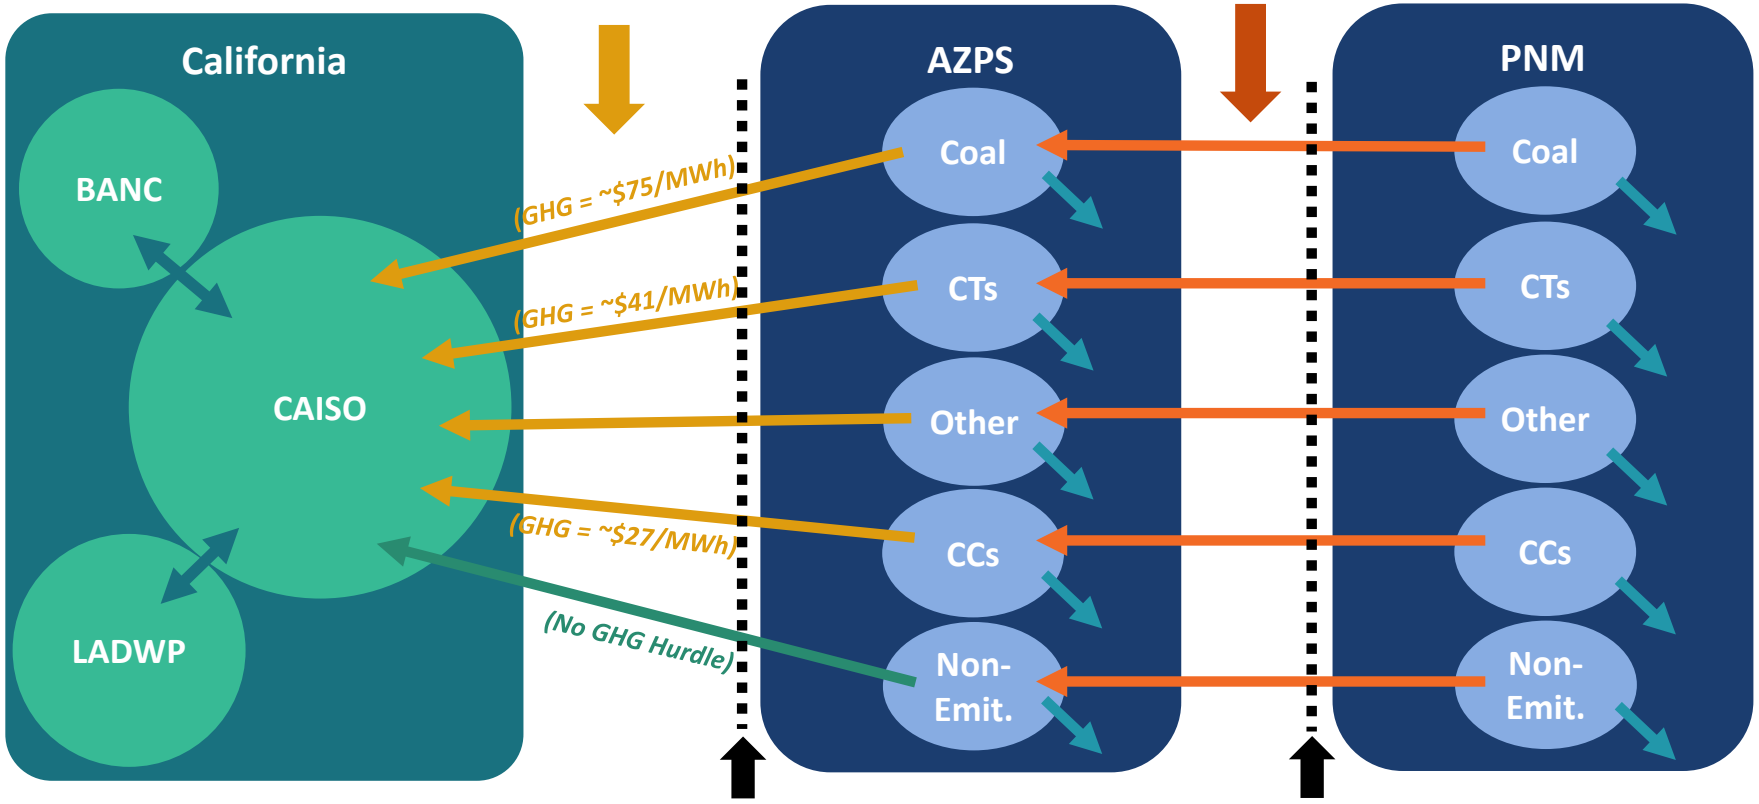


APPENDIX: EDAM MODELING ASSUMPTIONS

Sales incur unit GHG cost, relevant hurdles, and are limited by attributions from the GHG Reference Pass

Resources can sell into neighboring BAAs by paying applicable fees:

- Bilateral market: OATT fee, trading margin
- EIM: no hurdle on available transmission
- EDAM: no hurdle on Buckets 1,2, & 3



Resources serve load in their own BAA with no hurdle

Flows restricted to BAA export limit + BAA Net Export GHG Attribution Limit

A nomogram restricting total BAA-to-BAA flows to export limit, which varies by market type – bilateral, EIM, and EDAM

APPENDIX: PNM AND EPE MODELING ASSUMPTIONS

PNM Utility's system is summer-peaking with ~17 TWh of annual demand and a 3.3 GW peak. PNM Utility accounts for around 74% of total BA load.

APPENDIX: PNM AND EPE MODELING ASSUMPTIONS

PNM Generation Capacity Mix

- Current modeled capacity mix for PNM Utility is dominated by solar and battery resources.

PNM Installed Capacity

PNM BA Capacity

Type	Original	Current
	MW	MW
Battery	1,295	1,645
Coal	330	0
DR	0	0
Gas	1,746	886
Geothermal	10	11
Hydro	23	51
Nuclear	381	299
Solar	1,851	3,128
Wind	658	917

EPE Generation Capacity Mix

- Current modeled capacity mix is split between battery, gas, and solar.

EPE Installed Capacity

Type	Original	Current
	MW	MW
Battery	0	1,066
Solar	527	1,439
DR	47	0
Nuclear	591	622
Gas	1,449	1,034
Total	2,613	4,161

Note: Brattle's current model increases battery and solar resources to reflect EPE's renewable generation plans.
